AB	The wastewater treatment system is for membrane sepn. activated sludge wastewater treatment and comprises a treatment main tank kept in aerobic state, an aeration pipe for washing functional membranes filtering and sepg. sludge, a release part for adjusting the air flow rate in the aeration pipe, an adjustment valve installed in the release part for directly adjusting the air flow rate, and a throttle valve installed also in the release part for retaining the min. air quantity necessary to wash the functional membranes . The functional membranes can be washed without any trouble and clogging of the membranes can reliably be avoided.
